                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polymucleotide (I) and CC polymerase (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CP plymucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating artibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) as polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC diagnostics, forensics, gene mapping, identification or biological activity. CC The polypeptide and polypucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences.

The antigenic proteins, fragments, their nucleic acids and antibodies are used for diagnost prevention (as vaccines) or treatment of Neisseria infections,

New nucleic acid encoding polyketide-like synthesis enzymes of Vibrio marinus - and transformed plants and microbes that produce polyunsaturated fatty acids, useful as pharmaceuticals and food supplements

Example 1; Fig 5; 153pp; English.

The invention provides polyketide-like synthesis (PKS)-like genes that
are used for the production of long chain poly-unsaturated fatty acid
(PURA) productions. Genes responsible for eicosapentenoic acid (BRA)
production in Shewanella putrefaciens and novel genes associated with the
production of docosabexanoic acid (BRA) in Vibrio marinus are used to
production of docosabexanoic acid (BRA) in Vibrio marinus are used to
generate transgenic plants that can express transgenes encoding PKS-like
generate transgenic plants that can express transgenes encoding PKS-like
genes associated with PURA production. The PKS-like genes are used to
transform plants and microbial cells to give recombinants having altered
contents of PURA (specifically DHA and BRA). Oils from these plants are
useful as dietary supplements (in infant feeding formulations) to give a
VURA profile closer to that of human milk; for treating malnutrition, in
intravenous feeding formulations; in cooking oils, fats etc.), also as
anti-inflammancry agents and for reducing cholesterol levels. Fragments
Cfrom the genes are useful as probes to isolate related molecules or to
detect organisms that express PKS-like genes. The method facilitates
cfrom the genes are useful as probes to isolate related molecules or to
detect organisms that expression in microbes also allows simple
cspaticular PURA profile. Expression in microbes also allows simple
crecovery and control of PURA profile and is not subject to excernal
cvariables such as weather or food supply. The present sequence represents
cm approximately 40 kb PKS-like cluster DNA fragment from V. marinus
comprising open reading frames (ORFS) 6, 7, 8 and 9.

This invention describes novel DNA sequences encoding for polyketide and Schizochtrium. The nucleic acids are useful for isolating related molecules or in methods to detect organisms expressing the PKS-like genes. They are also useful for creating transgenic plants that express poly-unsaturated long chain fatty acids. The poly-unsaturated long chain fatty acids. The poly-unsaturated long chain patients undergoing intravenous feeding or for preventing or treating malnutrition. The poly-unsaturated long chain fatty acids produced recombinantly are useful as dietary supplements for patients undergoing intravenous feeding or for preventing or treating malnutrition. The poly-unsaturated long chain fatty acids can also be incorporated into cooking oils, fats or margarine formulated so that in normal use the recipient receives a desired amount of poly-unsaturated long chain fatty acids. The nucleic acids are also useful in large scale

Transgenic production of polyunsaturated fatty acids in particular host cells allows quicker purification from natural sources such as fish or plants. This sequence represents a vibrio marinus DNA fragment encoding the PKS gene cluster incorporating
                                        The present invention provides a DNA sequence encoding an icosapentaenoic acid-biosynthesising enzyme group-like protein group derived from a microbe having docosahexaenoic acid (DHA) productivity. The gene can be used for the industrial production of DHA. The present sequence is a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
genes in a first Bacillus cell relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cell relative to expression of the same genes in one or more second Bacillus cells. The method is useful for monitoring global expression of several genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions, environmental stress or other physiological provocation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 78
                                                                                                                                                                                                                                                                                              (ORPs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see AAY38499-Y38944). The antigenic proteins, their fragments, their mucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Scarlato V;

Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea -

Disclosure; Page 216; 1760pp; English.

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 crepresent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAA825620 to AAA81254 to AAA81259 and AAA81304 to AAA81321 represent FCR primers used in the CC AAA81259 and AAA81304 to AAA81321 represent FCR primers used in the CC AAA81259 and AAA81304 to AAA81321 represent FCR primers used in the Sequences; and AAA81322 to CAAA81452 represent Neisseria meningitidis DNA sequences; and AAA81322 to CC AAA81452 represent Neisseria meningitidis DNA sequences, and antibodies invention. The nucleic acid sequences, protein sequences, and antibodies composition can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or dispnosing infection due to CC medicament) for treating, preventing or dispnosing infection due to CC medicament) for treating, preventing or dispnosing infection due to CC Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences, and/or against all pathogenic Neissariae in the manufacture of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have also been tried but none have successfully covercome antigenic variability. The provision of further, complete exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions.

Sequence 447 BP; 110 A; 115 C; 114 G; 107 T; 1 other;

US-09-090-793-12
US-09-090-793-12
; Sequence 12, Application US/09090793
; Patent No. 6140486
; GENERAL INFORMATION:
    TITLE OF INVENTION: Production of polyunsaturated fatty acids by expr
    TITLE OF INVENTION: of polyketide-like synthesis genes in plants
; FILE REFERENCE: CGNE.131.01US
; CURRENT APPLICATION NUMBER: US/09/090,793
; CURRENT APPLICATION NUMBER: 05/0408,650

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/db xref="taxon:3055"
/clone lib="C. reinhardtii CC-1690, Deflagellation
(normalized), Lambda Zap II"
/note="Vector: pBluescript II SK-; Site_1: EcoRI; Site_2:
xhoI; Deflagellation library, constructed by John Davies
and Jeffrey McDermott, combines cDNAs from CC-1690 cells
which had been re-synthesizing flagella for 15, 30 and 60
min after being deflagellated by pH shock. PolyA mkNA was
purified from each sample, pooled and cDNA synthesized.
The cDNA was directionally cloned into lambda Zap II
(Stratagene) in the EcoRI (5') and XhoRI (3') sites.
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with Exassist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al., (1996) Genome Research 6: 791-806."
